Recognizing Asthma Symptoms in Your Child: What Parents Should Know

Asthma ranks among the most prevalent chronic conditions in children, and recognizing symptoms associated with asthma is crucial for managing your child's health and well-being.

Please note: No single symptom or combination of symptoms equals a diagnosis of asthma. The following information is meant to help you identify signs that may be present in children with asthma—not to serve as a diagnosis.

Common Symptoms of Asthma in Children

Persistent Coughing : Frequent coughing fits, especially at night, in the early morning, or after physical activity. Unlike typical colds, these coughs tend to linger even when other symptoms of illness are absent.

Chest Discomfort: Older children may describe tightness, pressure, or pain in their chest. Younger children might simply place a hand on their chest or appear uncomfortable without being able to explain why.

Shortness of Breath: Your child may seem to have trouble catching their breath, or may feel like they can't get enough air—even while resting.

Wheezing Sounds: A high-pitched, whistling sound when breathing. Sometimes it's easy to hear, but other times only your child may notice it.

Rapid Breathing: Breathing faster than usual, especially if it happens at rest or with only mild activity.

Unusual Fatigue: Excessive tiredness or weakness that interferes with daily play or activities can be a sign that asthma is not well controlled.

When to seek help

- If you notice any of these symptoms in your child, speak to your pediatrician. Based on the situation, a pulmonologist evaluation may be required.

- If your child has a diagnosis of asthma, but they frequently experience these symptoms, please contact our office.

Early evaluation and proper management can help your child breathe easier and enjoy all the activities they love.
